

Abstract: EduPredict - Academic Intelligence Platform

EduPredict is a sophisticated data science mini-project designed to analyze and predict student academic performance. Utilizing machine learning algorithms, specifically Random Forest Classifiers, this platform processes variables such as attendance, internal assessments, and participation to forecast student grades and identify at-risk individuals. The primary objective is to enable early interventions by educators, fostering an environment where targeted support can be provided. This repository includes a fully functional Streamlit dashboard that visualizes department-wise metrics, attendance progress, and feature importance, bridging the gap between raw educational data and actionable academic insights.
