

Problem Statement

Educational institutions collect vast amounts of data regarding student attendance, test scores, and participation. However, this data is rarely utilized proactively to identify students who may be falling behind. The lack of an integrated predictive system often leads to delayed interventions, resulting in higher failure rates and decreased academic success. EduPredict aims to solve this by providing a real-time, data-driven dashboard that accurately predicts student performance and highlights at-risk students using robust machine learning techniques, ensuring educators can intervene before final grades are determined.
